

CivicPulse — SIH Presentation Content

8 slides. Everything your team needs to build the deck — every feature, every screen, and what each one does.

Text in  blocks is a **speaker note** — say it out loud, don't put it on the slide.

- **Live app:** <https://civicpulse-black.vercel.app>
- **Tagline:** *Report it once. Track it to resolved.*

SLIDE 1 — Title & One-Line Pitch

CivicPulse *Report it once. Track it to resolved.*

A campus and city grievance platform where one photo becomes a tracked ticket, the community votes on what matters most, and fixing real problems earns you rewards.

Fill in for SIH:

- Problem Statement ID · Title · Theme
- Category: Software
- Team Name · Team ID

Open with the story, not the features: *"Everyone here has reported a pothole or a broken light and watched absolutely nothing happen. That's the problem. Not reporting — what happens after."*

SLIDE 2 — The Problem

Complaints go in. Nothing comes out.

What goes wrong	What it means for people
Anyone can report from anywhere	Fake and vague complaints; crews can't find the spot
Newest complaint shown first	A problem affecting 50 people sits below one affecting nobody
The same problem filed 10 times	The desk works one issue ten times over
You never hear back	You assume nobody read it, so you never report again

On campus it's worse — there's no system at all. Broken streetlights, overflowing bins and leaking taps get complained about in WhatsApp groups that no maintenance staff member is in.

The last row is the one that kills these apps. People don't stop reporting because reporting is hard. They stop because last time it vanished. Every feature we built exists to close that loop.

SLIDE 3 — How It Works: The Citizen Journey

Five steps, under a minute.

- | | | |
|--|---|--|
| 1. SNAP
Live camera
only, in-app | 2. AUTO-TAG
Location +
time captured
automatically | 3. TRACK
Submitted →
In Progress →
Resolved |
| 4. PROOF
Ward desk uploads an
"after" photo when fixed | 5. EARN
5 Pulse Points
for an approved
campus report | |

The three things that make it different:

-  **Live camera only** — no gallery uploads. You must physically be standing at the problem.
-  **Auto-geotagged** — location is captured with the photo, never typed.
-  **Every report gets an ending** — either *Resolved with photo proof*, or *Rejected with a written reason you can read*. Nothing silently rots.

"Live camera only" is the line judges remember. Demo it — try to upload from the gallery and show that there is no button for it.

SLIDE 4 — Citizen Interface (Screens 1–5)

Nine screens. Here are the five a citizen uses most.

-  **Home — Quick Report** The whole report in one bar: pick **City or Campus** (searchable, 26 institutions cities by name, state or pincode) → pick the **Issue type** (Pothole, Streetlight, Garbage, Water Leak, Other) → **Location** locks on capture → tap the **shutter**. Camera opens, you review the shot, confirm location, add an optional note (with one-tap ready-made descriptions), file it.
-  **Full Report Form** For detailed reports: category, **urgency** (Low / Medium / High), ward or campus, description, photo, location, and a department email for routing.
-  **My Complaints** Every report you've filed with a **live status trail** — Submitted → In Progress → Resolved — plus before/after photos, and if it was rejected, the exact reason the ward desk gave.
-  **Issues by Region** Search **any city or pincode** and see every reported problem there — photo, category, description, status, date, and who reported it. **Works without an account**. Each has an ▲ button to say "I have this problem too."
-  **Resolved Photos** A before-and-after gallery proving what actually got fixed.

Also built: **Escalation tracker** (live 24-hour countdown per open ticket), **Security settings** (change password), and a **full-screen photo viewer** on every image in the app — tap any photo to inspect the damage properly.

SLIDE 5 — Ward Control Desk (Admin Interface)

One dashboard where the maintenance desk runs everything.

Overview strip — the numbers at a glance: Total reports · Submitted · In Progress · Resolved · Rejected · **Open over 24h** (turns red) · Citizens registered · Feedback received

Three tabs:

 **Reports** — the work queue

- Filter by status, urgency, category, ward or date
- **Sorted by how many people are affected**, not by date
- Change status · **Correct a wrong category** · Upload the resolution photo
- **Reject with a reason** the citizen will read
- Reopen anything rejected by mistake
- **Export to CSV**

 **Feedback** — what people say about the app itself, filterable by Good / Okay / Bad, exportable

 **Citizens** — the registered roster, searchable, showing how many reports each person filed and how many are still open, exportable

Two decisions worth mentioning: rejection **always** requires a reason — it's a separate button, not a dropdown option, so a report can never be closed without an explanation. And the desk can **fix a wrong category** instead of rejecting, because a genuine complaint filed under the wrong label is still a genuine complaint.

SLIDE 6 — Community Power: Upvotes & No Duplicates

The feature that decides what gets fixed first.

▲ **"I have this problem too"** Browse your region, find a problem you're also affected by, tap ▲. That report climbs the ward desk's queue. **A problem affecting 20 people now outranks one filed five minutes ago.**

Smart duplicate detection When you try to report something already reported nearby, CivicPulse shows you that existing report's photo and asks:

"Already reported?"

Someone reported this 40m from here. [Yes — this is the same problem] [No, mine is different]

- **Yes** → your voice is added to the existing report. No duplicate created.
- **No** → your report files normally.

Why we ask instead of blocking: two genuinely different potholes can sit 40 metres apart. Silently refusing the second one would lose a real complaint and the person would never come back.

The result: one problem = one ticket, with an accurate count of how many people it affects.

Fairness rules built in: you can't upvote your own report, you can't upvote twice, and you can't upvote something already closed.

SLIDE 7 — Pulse Points: Rewards for Real Reporting

Civic participation that pays.

 **Earn:** 5 Pulse Points every time the ward desk **approves** one of your campus reports. **10 approved reports = 50 points.**

 **Redeem:**

50 Points	100 Points
₹100 Amazon voucher	₹250 Amazon voucher
₹100 Flipkart voucher	Spotify Premium — 3 months
Spotify Premium — 1 month	Apple Music — 3 months

Spend 50 and your balance returns to zero — or hold out for a bigger reward at 100.

The Pulse Points screen shows a gold coin with your balance, a progress bar to your next reward ("*15 more points — about 3 more approved reports*"), the reward grid, your claimed voucher codes, and a full history of every point earned and spent.

 **Why it can't be farmed — the key design decision:**

Points are paid on approval, not on upload.

Every rewarded reporting app gets gamed within a week because it pays the moment you submit a photo. Ours pays only when a **human at the ward desk accepts the report as real**. Junk earns nothing, no matter what gets past the camera. Rejected reports earn nothing. Upvoting earns nothing. Only city problems that actually get fixed put points in your account.

Also: campus reports only, one payout per report ever, and every point is a permanent record you can audit.

SLIDE 8 — Impact, Status & Roadmap

 **Built and live right now — not a mockup**  **civimpulse-black.vercel.app** (add a QR code here)

Working today: registration with phone + password (no OTP) · live camera capture with geotag · full report workflow · rejection with reasons · ward control desk with 3 tabs and CSV export · public regional search · upvoting · duplicate detection · Pulse Points and redemption · escalation countdown · photo viewer · in-app feedback

 **Impact**

Who	What changes
Students & residents	Problems get fixed, and you see the proof
Ward & campus desks	Work what affects the most people, not the newest
Municipal departments	Fewer duplicate dispatches; auto-escalation after 24h
Environment	Faster waste and water-leak response

How we'll measure it: time from report to resolution · % closed with photo proof · duplicate rate · and the one that matters — **do people report a second time?**

💰 **Costs ₹0 to run.** No SMS charges (no OTP), no maps API, free hosting and database. A campus can adopt it without a budget approval.

➡ **Next** Password recovery · automated escalation emails · voucher partnerships to stock real codes · trust levels for proven reporters · integration with municipal systems

End on the repeat-reporter metric. Every civic app can show reports filed. Almost none can show people **coming back** — and that's the only proof the loop is actually closed.

APPENDIX — For the team building the deck

Complete feature checklist

Reporting — live camera only · auto-geotag · 5 categories · 3 urgency levels · 26 campuses + city search by name/state/pincode · one-tap description templates · 200-character limit · quick report and detailed form

Tracking — ticket numbers (CP-2026-00001) · 4 statuses · live status trail · before/after photos · rejection reasons shown to the citizen · 24-hour escalation countdown · full-screen photo viewer

Community — public regional feed (no account needed) · upvoting · duplicate detection and merging · priority sorting by people affected

Rewards — 5 points per approved campus report · 6 rewards at 50 and 100 points · progress tracking · voucher code delivery · full points history

Admin — overview stats · filterable report queue · status and category editing · resolution photo upload · rejection with reasons · reopen · citizen roster · feedback inbox · CSV export on all three tabs

Accounts — phone + password, no OTP · change password · works signed out for browsing and feedback

Screenshots to capture

1. Home screen with the report bar
2. Camera capture in progress
3. "Already reported?" duplicate prompt
4. My Complaints with a status trail
5. Ward Control Desk showing the report queue with upvote badges

6. Pulse Points wallet with the coin and progress bar

7. Issues by Region with ▲ buttons

Slide-design rules

- Max ~6 lines of text per slide — detail goes in your mouth, not on screen
- One screenshot per slide minimum; this is a visual product
- Use the app's colours: deep green `#04241a`, emerald `#0f7a5a`, gold `#c8a65b`
- Put a QR code to the live site on Slide 8 so judges open it themselves

3-minute demo order

1. Home → pick campus + category → shutter → file a report
2. Second phone → same problem nearby → **"Already reported?"** → tap Yes
3. Admin → show it ranked by people affected → move to In Progress
4. Back to citizen → **Pulse Points: +5**

Record this as a video beforehand. Never demo live without a fallback.
